This project has received funding from the European Union's Horizon 2020 research and innovation programme under Grant Agreement no. 678760 (ATLAS). This output reflects only the author's view and the European Union cannot be held responsible for any use that may be made of the information contained therein.

ATLAS - At a Glance

A Trans-Atlantic assessment and deep-water ecosystem-based spatial management plan for Europe

Call: EU Horizon 2020: BG-2015-2
(Unlocking the potential of seas and oceans)

Duration: May 2016 – April 2020
(48 months)

Consortium: 24 partners + 1 linked
3rd party, from 12 countries

Budget: €9.3M

Coordinator: The University of
Edinburgh, Scotland (UK)

Focus: Providing essential new knowledge of North Atlantic ecosystems through data gathering and synthesis

Impact: Discoveries and outputs will inform and facilitate stakeholder agreement on marine policy and regulation and spur Blue Growth

Core activities: 25+ research cruises investigating 12 case studies across the Atlantic

Trans-Atlantic Collaboration

Assessing environmental risk with reference to fisheries

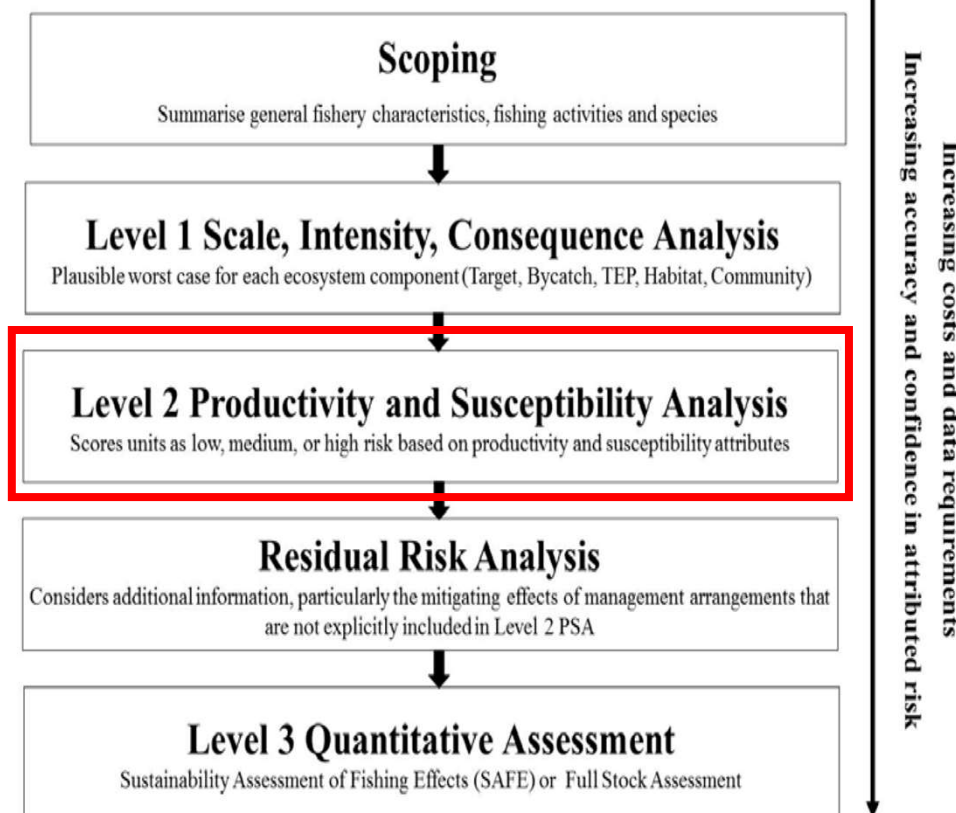

Ecological Risk Assessment for Effects of Fishing (ERAEF)

- Risk analysis based on the Ecological Risk Assessment for Effects of Fishing (ERAEF) developed by Hobday *et al.* (2011).
- Hierarchical framework consisting of three levels –
 - 1) qualitative assessment,
 - 2) semi-quantitative Productivity/Susceptibility Analysis (PSA),
 - 3) fully quantitative model-based risk assessment

Ecological Risk Assessment Hierarchy

Productivity and Susceptibility Analysis

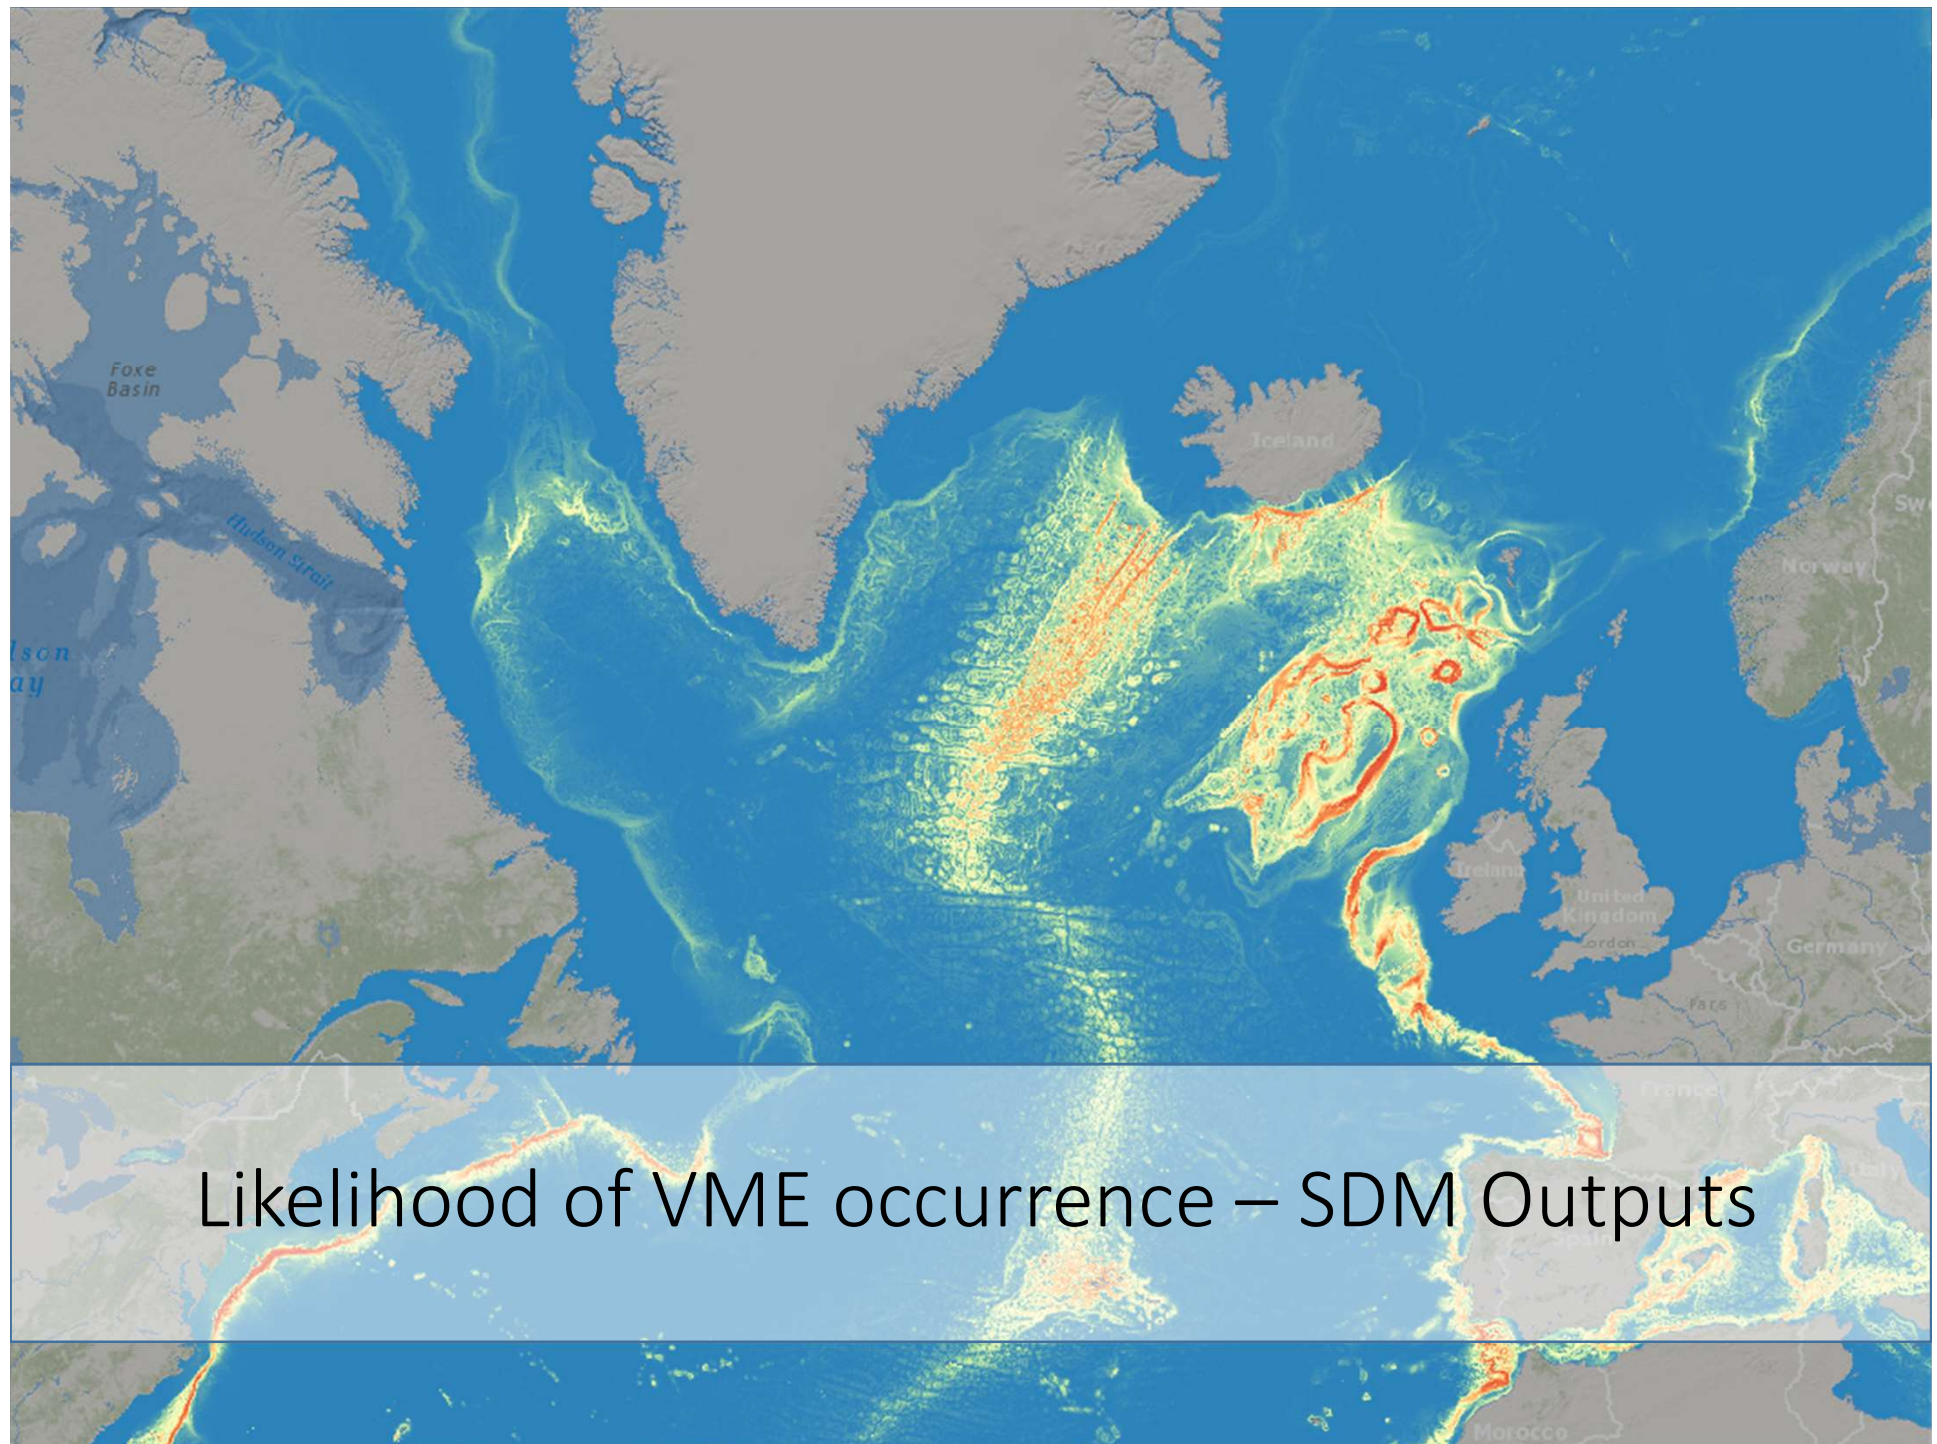

Availability

- Extents of VME/deep-sea fish habitat occurrence
 - Ecological Niche Models (ENM) developed for six VME indicator taxa, and six deep-sea fish species
 - Binary presence/absence habitat/species distribution maps derived from ENM outputs

Encounterability

- Likelihood of fishery interaction
 - Spatial data layers of Swept Area Ratio (SAR) produced for OSPAR by ICES using VMS data
 - Spatial data layers of fishing activity/trawling produced by Global Fishing Watch using AIS data

Madrepora oculata

Paragorgia arborea

Lophelia pertusa

Desmophyllum dianthus

Acanthogorgia armata

Acanella arbuscula

Convert model outputs to
binary presence-absence
using Maximum Sensitivity
and Specificity (MSS)
threshold

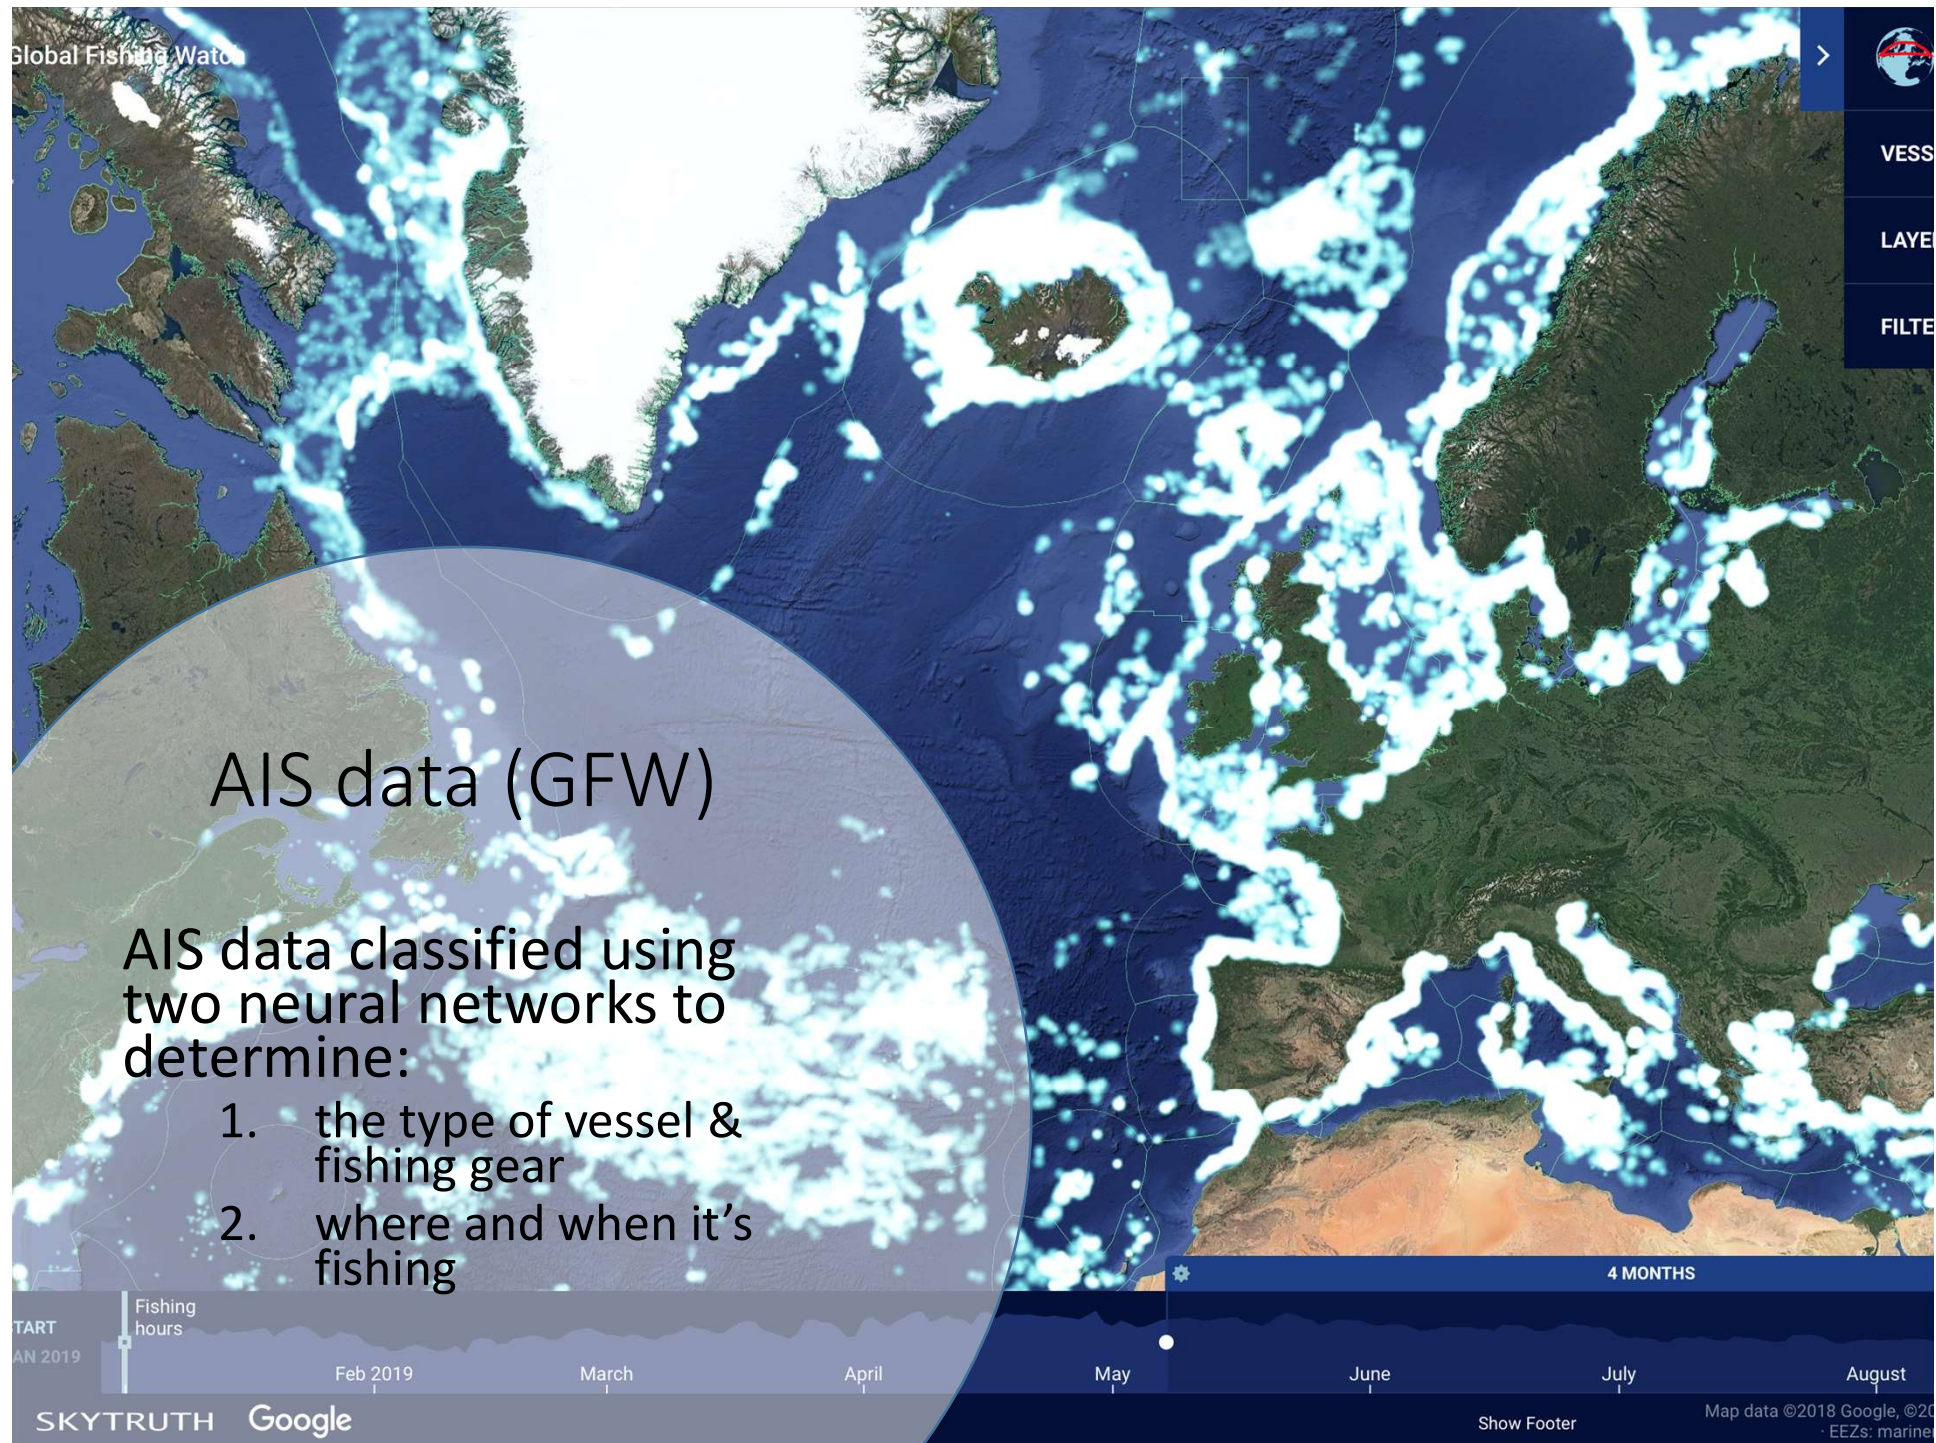

VMS data for OSPAR regions II and III (ICES)

Spatial data layers of surface/
subsurface swept area ratio
calculated on basis of:

1. VMS speed and course data
2. EU logbook data on vessel size and gear type

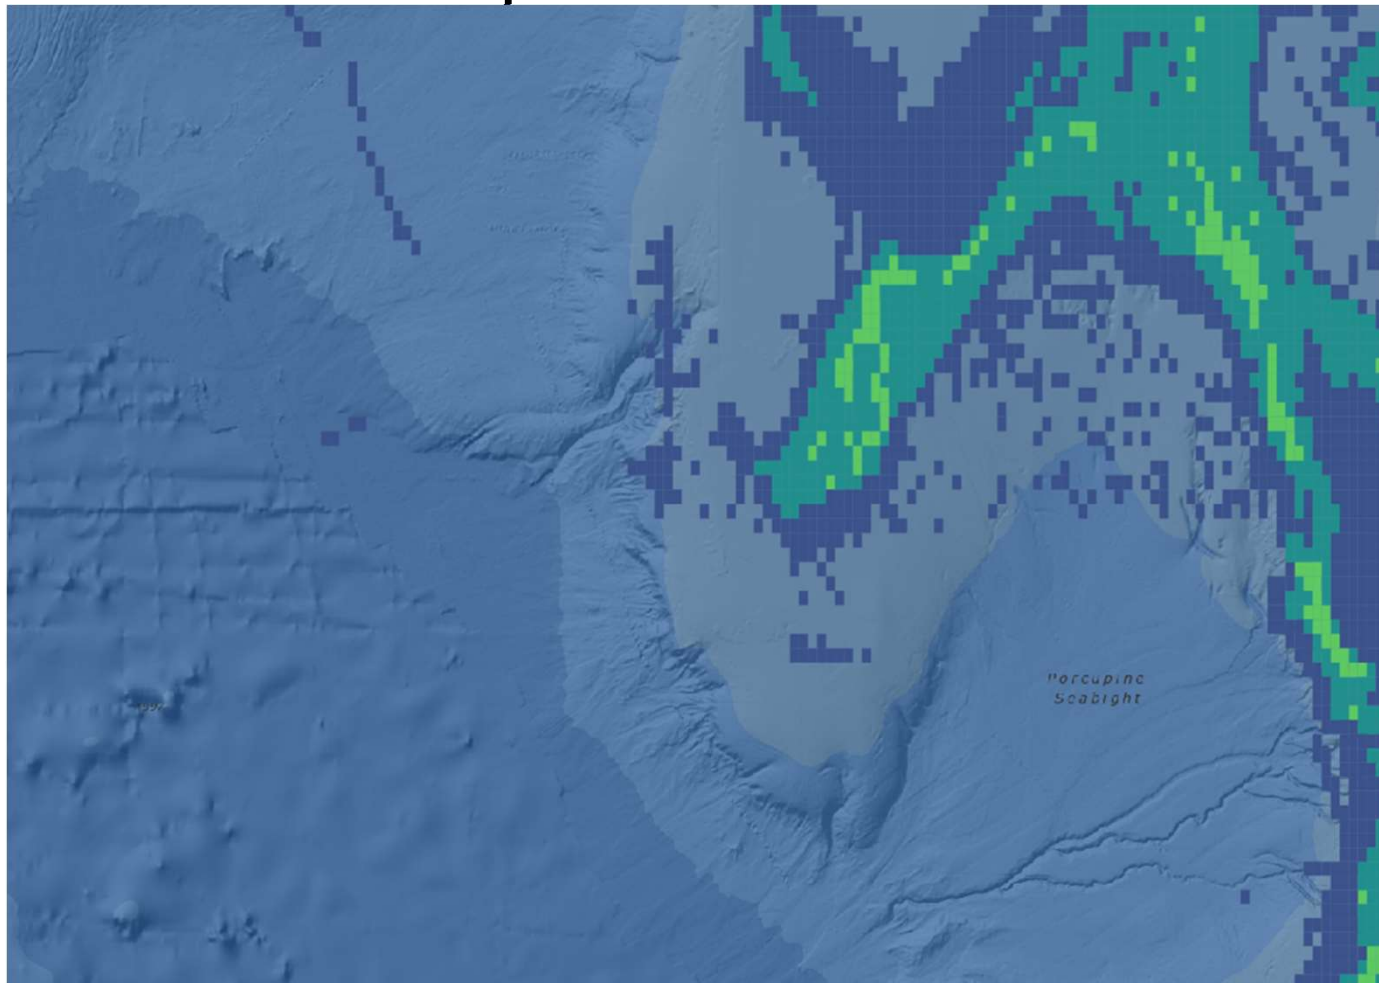

AIS / VMS Comparison

AIS / VMS Comparison

AIS / VMS Comparison

AIS / VMS Comparison

AIS / VMS Comparison

Assessment Results

AIS Data -> SAR Model

SAR Based Risk Score

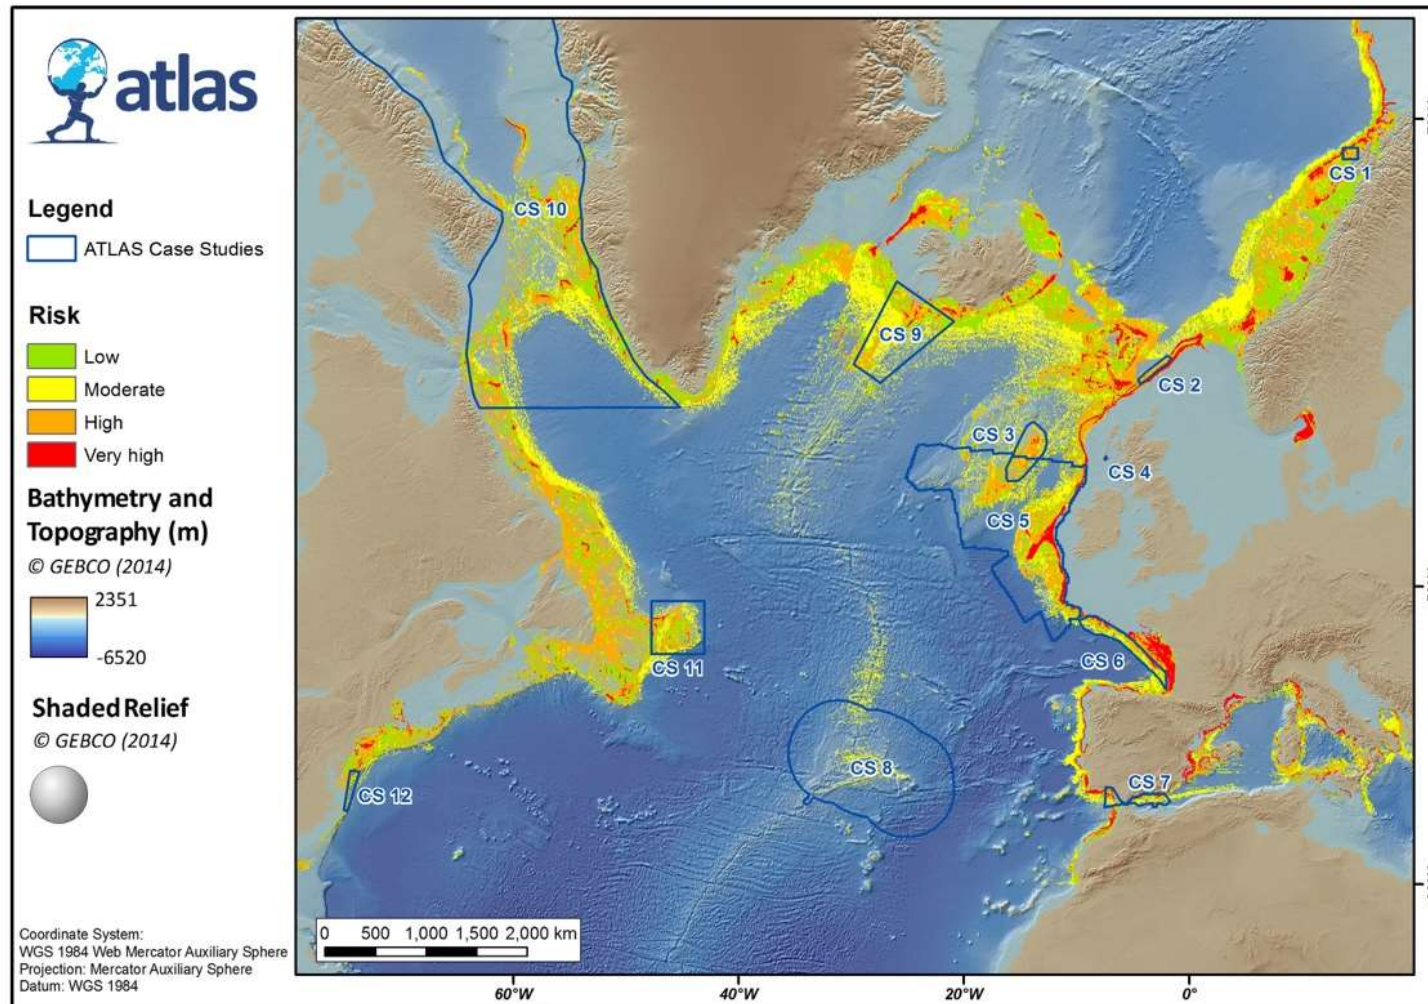

Model Based Risk Score

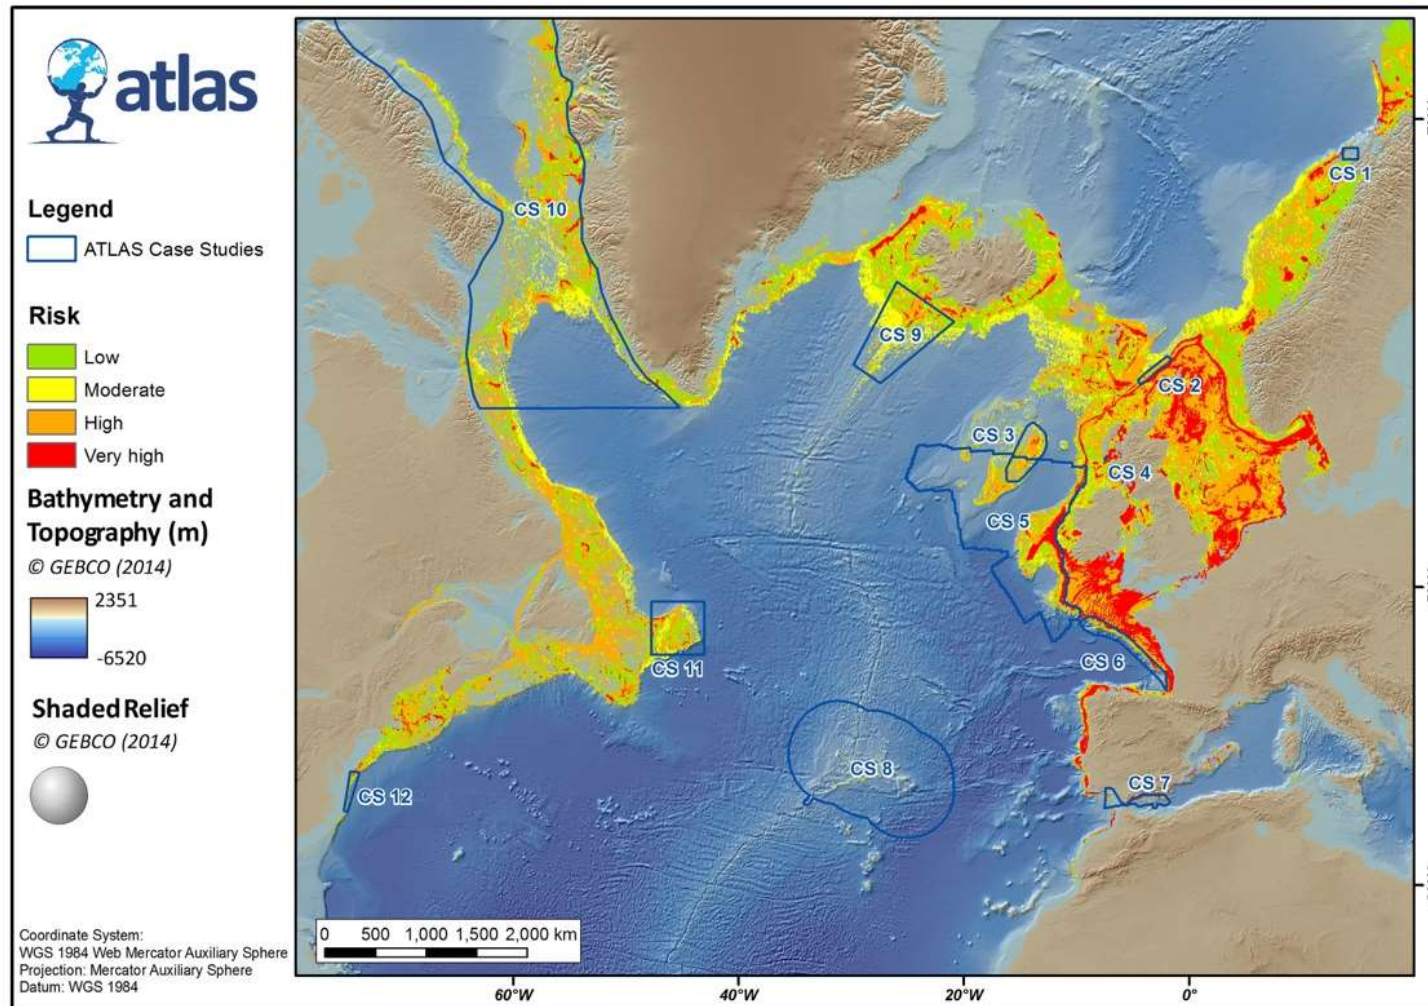

Model Performance on Test Data Set

	Percentage of records	Cumulative percentage
Accurate Predictions	69.2%	69.2%
Overestimate by 1 class	11.5%	80.7%
Overestimate by 2 classes	1.9%	82.6%
Overestimate by 3 classes	0.1%	82.7%
Underestimate by 1 class	12.2%	94.8%
Underestimate by 2 classes	5.1%	99.9%
Underestimate by 3 classes	0.1%	100.0%
Σ :	100.0%	

Risk posed to VME from pressures due to fishing activity across the North Atlantic Basin

Risk posed to deep-sea fish habitat from pressures due to fishing activity across the North Atlantic Basin
